

# Dobrova, Slovenia

An integration of DEM shaded relief  
with enhanced optical imagery

The area of focus in this map is Dobrova, Slovenia, located less than 10 kilometers west of Slovenia's capital city, Ljubljana. This area was chosen because it has particular meaning to the map creator, as this is the home village of her paternal grandfather. This map was produced by enhancing Landsat 8 OLI imagery, which was then laid on top of a Digital Elevation Model (DEM) shaded relief file. In order to allow for visibility of the underlying shaded relief, the opacity of the true colour composite was decreased, allowing the viewer to gain perspective of the underlying elevation patterns of the landscape.
